

How the analysis moves from goal to decision

01 Business Objective What the business has decided it needs to accomplish, stated with its constraints. It ensures the ML research stays aligned with that goal. OUTPUT: A DECISION WORTH MAKING	02 Analytical Plan Translates the business goal into analytical questions that data can actually answer, and specifies the method for each. This document guides the ML research. OUTPUT: ANSWERABLE QUESTIONS AND A METHOD	03 ML Research + Supporting Tools Where the ML research is conducted and documented so it is repeatable. It also produces the supporting tools for analysis. OUTPUT: VERIFIED RESULTS	04 Case Study Results turned into an argument: what was found, why it holds, what it means for the business. OUTPUT: A NARRATIVE	05 Executive Presentation The recommendation, its range, and the decision asked for, stripped to what leadership must act on. OUTPUT: A DECISION

FRAME

DESIGN

EXECUTE

INTERPRET

DECIDE

06 Implementation The approved change goes live, with the expected outcome recorded up front so there is something to be measured against. OUTPUT: A BASELINE ON RECORD	07 Monitoring The same metrics the model forecast, tracked on a fixed cadence, not a new dashboard of whatever is convenient to collect. OUTPUT: OBSERVED RESULTS	08 Evaluation Actual against expected. Is the gap inside the forecast range, or did the model miss, and which assumption caused it? OUTPUT: A VARIANCE, EXPLAINED	09 Course Correction If results fall short, adjust: scale back, re-target the segments that underperformed, or roll back where the downside case is realising. OUTPUT: A REVISED ACTION	Back to 02 / 03 Observed results become new data. The plan is amended where it was wrong, the notebooks refit, and the forecast is reissued. OUTPUT: A BETTER MODEL

ACT

MEASURE

COMPARE

ADJUST

RELEARN

Each artifact is written for a different reader. The plan is for a peer who will challenge the method; the notebooks are for anyone who needs to rerun it; the case study is for a manager; the presentation is for whoever signs off.

Neither line is one-directional in practice. Results that contradict the plan send you back to stage two rather than forward to stage four, and a shortfall after launch is treated the same way, as evidence about the model rather than a number to report.
